INTRODUCTION

Quick guides on removing and replacing your steering wheel!

I ordered this amazing custom steering wheel from Dallas Custom Steering Wheels and couldn't be happier . The install is super easy as well

TOOLS:

- [3/8" Ratchet](#) (1)
 - [3/8" Torque Wrench](#) (1)
 - [12 point M12 Socket](#) (1)
 - [Torx Socket Set](#) (1)
-

Step 1 — Disconnect Battery & Center Wheel

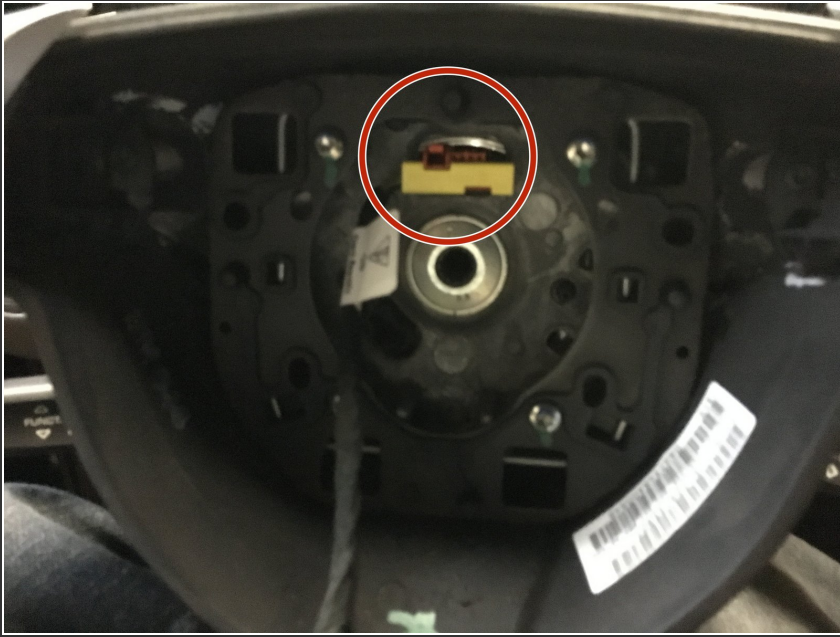

- Center Steering Wheel & Remove Key from the ignition
- Using a 10mm wrench, disconnect the positive battery terminal

Step 2 — Release AirBag

- Insert a 3/16" long allen key to release the airbag spring... the release hole is located on the bottom side of the steering wheel.
- ⓘ When inserting the tool into the opening... you will feel some spring tension. Push firmly upwards and the airbag will begin to release its 4 clips

Step 3 — Remove Airbag connection

- Be certain the cars battery is disconnected before doing this. Otherwise you will get an airbag fault

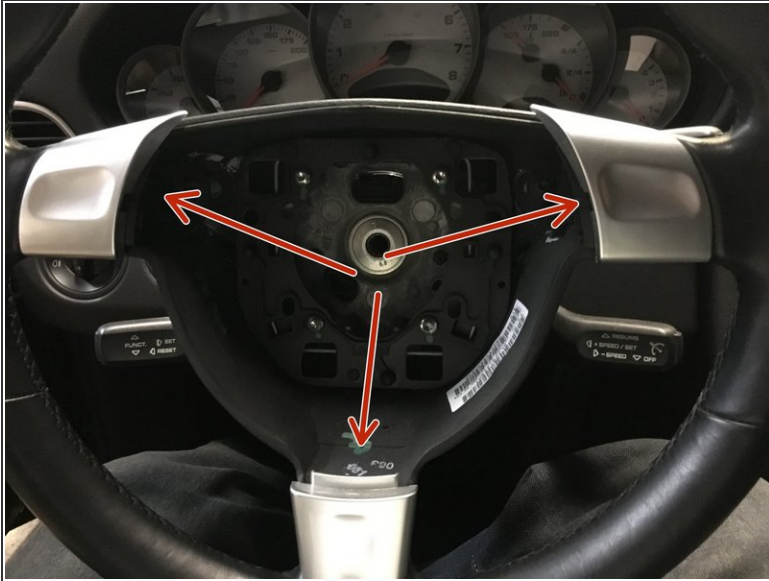

Step 4 — Remove steering wheel bolt

- Using a 12 Point Socket 12MM size.... remove the bolt.

⚠ Do Not Use a standard Torx socket... you risk damaging the threading.

Step 5 — Remove trim panels

- Using a torx socket... remove the left and right trim
- Using a delicate pry bar... remove the bottom trim piece. I had the best luck, working from the lowest point of the wheel.

⚠ There are 2 small metal washers behind the side trim torx screws. Do not drop them!

i Using a sharpie , mark the center point of the steering shaft spline for reference.

Step 6 — Install New Wheel

- Slide the steering wheel firmly onto the steering shaft spline. Be certain to center the wheel exactly how you removed it.
- Apply blue thread locking compound
- Tighten to 37ft lb
- Install any trim pieces you removed from the old wheel.

Step 7 — Airbag install

- Simply reconnect the airbag and push firmly onto springs.
- Reconnect Battery Terminal
- Quick Drive will clear any warning lights from the battery disconnect.
- Enjoy your new steering wheel!
